Split Plummer Block Housings SNS

For shaft diameters of
115 mm to 530 mm and
 $4\frac{7}{16}$ inch to $19\frac{1}{2}$ inch

Foreword

New generation of housings

Plummer block housings SNS represent a completely new generation of large size housings. Through the systematic further development of the proven FAG plummer block housings, Schaeffler can offer even greater efficiency and cost-effectiveness for machinery and plant.

Longer bearing life

The unique housing design gives an increase in the life of the spherical roller bearings fitted in the housing of up to 50%. This is achieved through optimised load distribution in the bearing that occurs due to the interaction of the bearing and housing geometry under load.

Advantages

The most important advantages of the newly developed plummer block housings SNS can be summarised as follows:

- Longer bearing life due to the innovative housing design. This gives lower maintenance and downtime costs of the entire machine or plant.
- Increased strength and shock resistance due to the use of spheroidal graphite cast iron as standard. The highly robust housings are ideally suitable for aggressive environmental conditions such as those in mining applications.
- Different sealing variants allowing matching to an environment with particularly harsh contaminant and dust conditions.
- Optimum lubricant supply to the bearing independent of the bearing position by means of a special lubrication groove in the interior of the upper housing section and through grease outlet holes in the lower housing section.
- Design with good anti-corrosion characteristics and reduced cleaning requirements due to inclined run-off areas as well as a projecting upper housing section.
- Indentations indicating the shaft and bearing centre, ensuring rapid and simple alignment of the housing.
- Machined locating surfaces on the housing base, allowing precise alignment of the housing.
- Serial numbering on both halves of the housing, ensuring their correct allocation. This prevents incorrect transposition between the pairs of upper and lower housing sections.
- Prepared mounting points allowing immediate use of Condition Monitoring.

Schaeffler systems competence

As one of the world's leading rolling bearing manufacturers, Schaeffler offers highly developed solutions for the design and operation of widely varying bearing positions. The bearing housing is an important element for achieving a matched overall concept.

Split plummer block housings SNS

Features

Split FAG plummer block housings SNS and the associated bearings form bearing arrangement units that can be matched, through the specific selection of seal design, lubrication type and bearing mounting, to a wide range of requirements. The housings are specifically designed for the fitting of spherical roller bearings.

Modular concept

The housings are designed in accordance with a modular concept. Each housing can be fitted with spherical roller bearings of various diameter and width series. Depending on their design, the bearings can be located either directly on the shaft or by means of an adapter sleeve. For the same bore diameter of a bearing, this leads to different shaft diameters. The spacings between the shaft and housing body are compensated by means of appropriately matched seals. Appropriate housings, seals and covers are available for each spherical roller bearing, see dimension tables. One or more series of plummer block housings SNS are suitable for each series of spherical roller bearings, see tables.

Dimensions

Plummer block housings SNS are available for shaft diameters from 115 mm to 530 mm and from $47/16$ inch to $19\frac{1}{2}$ inch.

The dimensions of the housings conform to ISO 113.

FAG plummer block housings SNS are a further development of the FAG plummer block housings SD31. The design envelope and mounting dimensions of both series of housings are identical and the housings are interchangeable 1:1.

The interchangeability with other series of FAG housings is as follows:

- All bearing series that can be combined with the FAG plummer block housings SD5 and SD6 can be fitted in plummer block housings SNS.
- Bearing series that can be combined with the FAG plummer block housings S30 can only be fitted in certain cases in plummer block housings SNS.

The dimensions of housings SD5, SD6 and S30 are not identical with the dimensions of housings SNS.

Locating and non-locating bearings

The bearing seats in the housing are machined such that the bearings are movable and can thus function as non-locating bearings. Locating bearing arrangements can be achieved by the insertion of locating rings NFR on both sides of the bearing outer ring. Locating rings must be ordered separately.

Housing material and outer surfaces

Plummer block housings SNS are manufactured as standard from spheroidal graphite cast iron. As a result, their strength and shock resistance are significantly higher than in the case of the previous standard material of flake graphite cast iron. The material spheroidal graphite cast iron is indicated by the suffix D.

The outer surfaces of the housings have a universal paint coating (colour RAL 7016, anthracite grey). The coating can be finished using all synthetic resin, polyurethane, acrylic, epoxy resin, chlorinated rubber, nitrocellulose and acid-hardening hammer tone finishes.

Longer bearing life

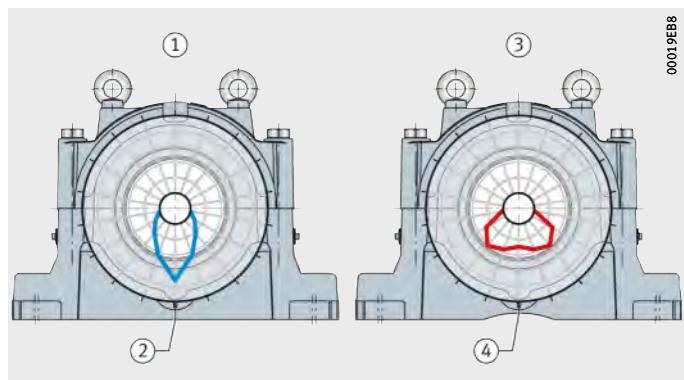

In the case of FAG plummer block housings SNS, the life of the spherical roller bearings fitted is up to 50% higher than in the case of conventional plummer block housings. The increase in life is dependent on the application, the load and the bearing design. Calculation of the bearing life is based on the calculation software BEARINX®. The reason for the longer bearing life is the optimum load distribution in the bearing that is achieved as a result of the new housing design, *Figure 1*.

Conventional plummer block housings are designed such that the bearing load is introduced into the housing locating face by means of a support area directly below the bearing, *Figure 1, ②*. If loading is in the main load direction, namely with an orientation vertical to the housing locating face, an unfavourable load distribution occurs in the bearing. Due to the narrow load zone, the load is distributed over only a small number of rolling elements, leading to a particularly high load maximum on the roller in the apex position.

In the case of plummer block housings SNS, a material recess below the bearing distributes the support area over two symmetrically arranged support faces, *Figure 1, ④*. This leads to a significant improvement in the load distribution in the bearing. The load zone is wider and the load is distributed more uniformly over several rolling elements. The maximum is now present on the two neighbouring rollers of the roller in the apex position and is reduced. This results in a significant increase in the fatigue life of the rolling bearings.

Split plummer block housings SNS

Advantages of the detailed design

A large number of details in the housing design that are systematically matched to practical application allows a particularly flexible and economical usage of plummer block housings SNS, *Figure 2*.

- ① Lubrication hole with long axial lubrication groove
- ② Pilot hole at predefined position for condition monitoring
- ③ Grease outlet holes
- ④ Indentations indicating shaft and bearing centres
- ⑤ Inclined run-off areas
- ⑥ Machined locating faces
- ⑦ Prepared mounting points for condition monitoring
- ⑧ Marking of housing halves
- ⑨ Dismounting notches
- ⑩ Projection of upper housing section

Figure 2
Advantages of detailed design

Lubrication hole with long axial lubrication groove

A lubrication hole M10×1 with a long axial lubrication groove in the upper housing section ensures supply of lubricant irrespective of bearing position to all bearing series that can be fitted, *Figure 2*, ①. Suitable lubrication nipples are supplied with each housing.

Grease outlet holes

Grease outlet holes in the lower housing section allow the escape of used and superfluous grease during relubrication, *Figure 2*, ③.

Indentations indicating shaft and bearing centres

Indentations in the lower housing section indicate the shaft and bearing centres in the housing, *Figure 2*, ④. This allows rapid alignment and reduces mounting time.

Inclined run-off areas	Inclined run-off areas on the upper and lower housing section promote the removal of fluids and reduce deposits of contamination, <i>Figure 2, ⑤</i> . This leads to reduced cleaning work and a lower risk of corrosion.
Machined locating faces	Machined locating faces on the lower housing section allow precise alignment of the housing, <i>Figure 2, ⑥</i> . Since the locating faces are raised, strips can be used as an alignment aid. One-off alignment is sufficient to allow rapid interchange of the housing when necessary.
Prepared mounting points for condition monitoring	In order to allow the uncomplicated use of Condition Monitoring, the lower housing section has a connection facility on both sides for condition monitoring systems, <i>Figure 2, ⑦</i> . Due to the thread M6 and a spot face of 26 mm on the diameter, it is possible to directly connect FAG SmartCheck, a modular online measuring system for machine monitoring. Alternatively, other vibration sensors can also be connected. If neither of the two connection points is accessible as a result of the adjacent construction, a further suitable connection point on the upper section is indicated by a pilot hole, <i>Figure 2, ②</i> . FAG SmartCheck must be ordered separately. For detailed information, see TPI 214, FAG SmartCheck or www.FAG-SmartCheck.de .
Marking of housing halves	The upper housing section and lower housing section are matched to each other and must not be transposed with other housing halves. The serial numbering on both halves of the housing ensure their correct allocation, <i>Figure 2, ⑧</i> . Furthermore, the serial numbering allows traceability and simplified documentation.
Dismounting notches	Recessed dismounting notches on the interface of the housing halves make it easier to remove the upper housing section, <i>Figure 2, ⑨</i> .
Projection of upper housing section	The projection of the upper housing section prevents the collection of fluids and contaminants at the interface of the two housing halves, <i>Figure 2, ⑩</i> . This leads to reduced cleaning work and a lower risk of corrosion.

Split plummer block housings SNS

Possible combinations

The modular structure of the plummer block housings SNS facilitates numerous possible combinations.

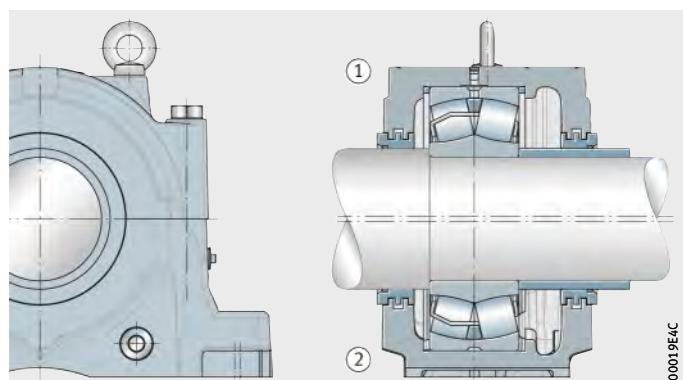

Based on the standard components, the housing can be combined as follows:

- location of bearings with a cylindrical bore directly on a stepped shaft or location of bearings with a tapered bore on a smooth shaft by means of an adapter sleeve
- sealing of the housing by means of a labyrinth seal or a Taconite seal
- with a continuous shaft or a housing closed on one side
- design of the bearing arrangement as a locating bearing arrangement or a non-locating bearing arrangement.

The resulting possible housing configurations, *Figure 3* to *Figure 10*, page 12 make it possible to fulfil various requirements on the bearing positions by means of standard components.

Combination with products for maintenance

The housings are suitable for connection of systems for preventive maintenance such as Condition Monitoring or automatic lubricators. Schaeffler offers a wide range of such products.

Further information on maintenance products

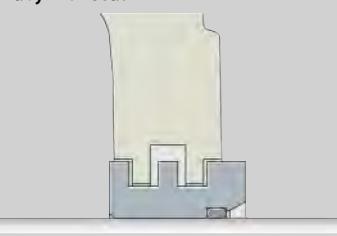

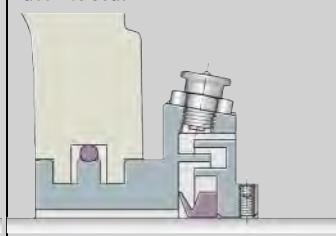

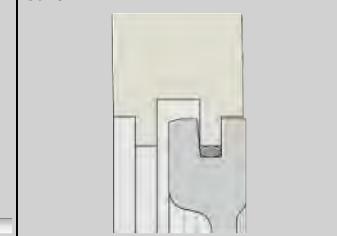

- Catalogue IS 1, Mounting and Maintenance of Rolling Bearings.

Seals and covers	For sealing of the bearing housings, the standard seals available are the labyrinth seal and the Taconite seal. These seals are matched to the rectangular section annular slots on both sides of the housings.
Labyrinth seals NTS	<p>Labyrinth seals NTS give non-contact sealing. They are therefore suitable for high circumferential velocities. The round cord made from fluoro rubber FKM pressed between the labyrinth ring and shaft is suitable for temperatures up to +200 °C.</p> <p>The labyrinth seal allows shaft misalignment of up to 0,3° in both directions and is suitable for grease lubrication. If necessary, the labyrinth can be relubricated. For this purpose, a lubrication hole must be made in the upper housing section for each labyrinth seal. The optimum positions are indicated by means of pilot holes.</p> <p>Labyrinth seals must be ordered separately. They are supplied individually. If a continuous shaft is present, two seals must be ordered.</p>
Taconite seals NTC	<p>Taconite seals NTC are combined FAG seals comprising a labyrinth seal and a V-ring. These seals are suitable for extreme operating conditions in relation to contamination and dust. The V-ring made from NBR is suitable for temperatures up to +100 °C.</p> <p>The Taconite seal allows shaft misalignment of up to 0,3° in both directions and is suitable for grease lubrication. For relubrication, the seal is fitted with a lubrication nipple.</p> <p>Taconite seals must be ordered separately. They are supplied individually. If a continuous shaft is present, two seals must be ordered.</p>
Covers NDK	<p>Covers NDK are used with housings closed on one side. The covers fit in the rectangular section annular slots in the housings. They are suitable for temperatures up to +200 °C.</p> <p>The covers must be ordered separately.</p>
Characteristics and operating limits	The characteristics and operating limits of the standard seals and covers are compared in an overview, see table, page 14.

Split plummer block housings SNS

Grease lubrication

Plummer block housings SNS are principally suitable for grease lubrication. For initial lubrication, the basic rule is that the bearing should be filled with grease to 100% and the free volume of the housing to 60%. The free volume is the space that remains in the housing once the bearing, adapter sleeve, shaft and seals have been fitted.

The recommended grease quantity can also be stated in grams once the density of the grease has been taken into consideration, see table.

The recommended grease quantity in the table takes account of the following:

- filling of the free volume to 60%
- grease with a density of 0,9 g/cm³.

**Recommended grease quantity
for selected housing/bearing

SNS3244-H-D	23244..-K	H2344	9 360	5 050

Information on the recommended grease quantity for other housing sizes is available by agreement.

In order to achieve a long operating life and high operational security of the bearing arrangement, we recommend the use of the rolling bearing greases Arcanol. These have been designed and tested for bearing arrangement engineering.

The recommended degree of filling for the greasing of bearings may deviate, as a function of the application and speed, from 100%.

**Further information
on the lubrication
of rolling bearings**

Grease changes

In order to renew the lubricant, a grease change is always recommended in which the grease in the bearing and housing is completely replaced.

A grease change requires opening of the bearing housing. If unfavourable environmental conditions are present, there is therefore a risk of contamination being carried into the housing. In addition, standstill of the machine during the grease change is unavoidable. It must therefore be checked in each individual case whether relubrication should be carried out in preference to a grease change.

Split plummer block housings SNS

Relubrication

If relubrication is carried out on bearings with a circumferential lubrication groove, the grease is introduced into the housing via the central lubrication hole, *Figure 11, ①*. The screw plug must therefore be removed from the upper housing section and permanently replaced by one of the lubrication nipples supplied. In this type of relubrication, the grease acts directly on the bearing.

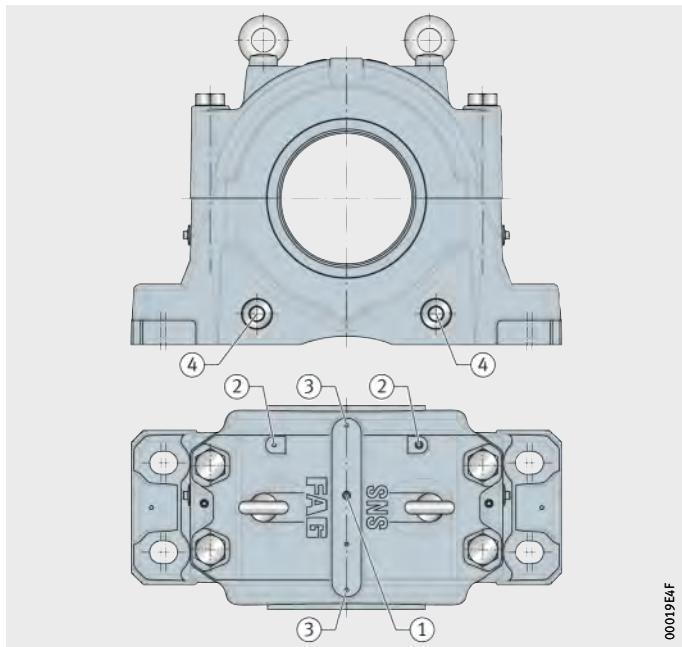

In order to prevent overgreasing, the screw plugs must be removed from the two grease outlet holes in the lower housing section for the duration of relubrication, *Figure 11, ④*. This allows the superfluous grease to escape. The grease outlet holes must then be closed off again using the screw plugs.

For the relubrication of bearings without a lubrication groove, two relubrication points are provided in the upper housing section, *Figure 11, ②*. One of the two points has a threaded hole M10×1, while the other is indicated by a pilot hole.

Lubrication holes can be provided at two further points for relubrication of labyrinth seals, *Figure 11, ③*.

- ① Central lubrication hole,
for bearings with lubrication groove
- ② Points for relubrication
of bearings without lubrication groove
- ③ Points for relubrication of labyrinth seals
- ④ Grease outlet holes

Figure 11
Points for relubrication

00019E4F

Lubrication nipples with dust cap are supplied as follows:

- button head lubrication nipples in accordance with DIN 3404-M10×1
- taper type lubrication nipples in accordance with DIN 71412-AM10×1.

In the interests of the environment, controlled metering must be ensured. Any grease that escapes via the grease outlet holes must be collected by means of a suitable device.

If unfavourable environmental conditions are present, there is therefore a risk of contamination being carried into the housing when the grease outlet holes are opened.

Split plummer block housings SNS

Automatic lubricators

The plummer block housings SNS can also be connected directly to automatic lubricators, such as the FAG CONCEPT8, *Figure 12*.

Design and safety guidelines

Load carrying capacity

The permissible load on the housing is dependent on:

- the strength of the housing
- the strength of the connecting screws
- the load carrying capacity of the bearing
- the load direction.

Guide values are given for the rupture load of the housings and the maximum load carrying capacity of the screws connecting the upper and lower sections of the housing, *Figure 13* and table, page 22. The guide values are valid for purely static loading. Guide values for other housing sizes are available by agreement.

The values in the table apply if the mounting surface of the mating parts is in accordance with DIN ISO 2768-H. A precondition for supporting loads is that the housing base surface is completely and rigidly supported.

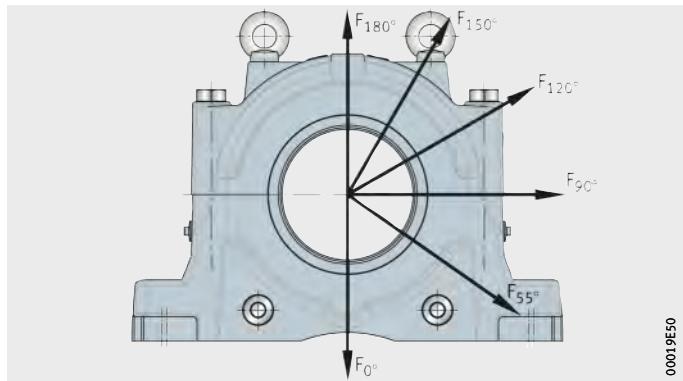

When determining the permissible static load, safety factors must be applied. For general machine building, the safety factor 6 relative to the housing rupture load is normally applied. Based on the precise calculation of the housing rupture loads using the Finite Element method and the use as standard of spheroidal graphite cast iron as the housing material, the safety factor 5 is sufficient for plummer block housings SNS.

A safety factor is not required for the values given for the load carrying capacity of the connecting screws.

If the housing is subjected to axial load, the permissible axial load of the bearing fitted must be taken into consideration. If the bearing is located on the shaft using an adapter sleeve, the axial retaining force of the bearing and adapter sleeve must also be taken into consideration.

Split plummer block housings SNS

Permissible shaft end designs

In the case of a housing closed on one side, the length of the shaft in the housing must be restricted such that no contact occurs between the shaft and the cover. In this case, the displacement facility of the bearing in a non-locating bearing arrangement must be taken into consideration. The basis for determining the permissible length of the shaft is the spacing between the centre of the bearing seat and the cover, see table.

a_d = spacing between
centre of bearing seat and cover

Mounting and dismounting Correct mounting has a decisive influence on the achievable bearing life. For this reason, careful attention must be paid to the following information.

**Surface quality
of the mounting surface**

The requirements for the surface on which the housing is to be mounted are as follows:

- sufficiently robust to withstand the static and dynamic loads occurring in operation over the long term
- surface roughness $R_a \leq 12,5$
- flatness tolerance to IT7, measured across the diagonal
- free from colour.

Compliance with these requirements is the basis for the operational security of the housing and a long operating life of the bearing fitted.

**Horizontal fixing
of the housing**

In addition to the foot screws, horizontal fixing of the housing is necessary if one of the following conditions is fulfilled:

- The load angle is between 55° and 120° , *Figure 13*, page 21.
- Axial load is present.

It is recommended that the horizontal fixing is carried out by means of stops in the load direction. The lower housing section is therefore provided with machined locating faces.

Eye bolts

The upper housing section has 2 eye bolts in accordance with DIN 580. These are intended as locating points for mounting and dismounting of the housing. The load carrying capacity of the eye bolts allows lifting of the housing including a bearing fitted in the housing.

Eye bolts must always be screwed fully into the housing.

Eye bolts should only be used for lifting the housing including the bearing fitted in the housing. During lifting by means of the eye bolts, no other machine or plant components should be connected to the housing.

Split plummer block housings SNS

Foot screws

Foot screws, see table, are used to screw mount housings to the mounting surface.
Foot screws are not included in the scope of delivery of the housings.

The tightening torques in the following table are maximum values for metric coarse-pitched threads to DIN ISO 962 and DIN ISO 965-2 and head contact dimensions to DIN 931, DIN EN ISO 4017, DIN EN ISO 4032, DIN EN ISO 4762, DIN 6912, DIN 7984, DIN 7990 and DIN EN ISO 8673.

They are valid with 90% utilisation of the yield stress of the screw material 8.8 and a friction factor of 0,14. We recommend that foot screws should be tightened to 70% of these values.

Maximum tightening torques, see table.

Maximum tightening torques for foot screws with metric threads to DIN ISO 962 and DIN ISO 965-2

Nominal screw size	Maximum tightening torque Nm
M24	740
M30	1 450
M36	2 600
M42	4 000
M48	6 000

Location of bearings with a tapered bore on the shaft

Bearings with a tapered bore are located on the shaft in plummer block housings SNS by means of adapter sleeves. The adapter sleeve is slid onto the shaft first and then the bearing is slid onto the taper of the adapter sleeve. As a result, the radial internal clearance of the bearing is reduced. At the same time, a radial preload occurs between the bearing inner ring, adapter sleeve and shaft, ensuring the rigid seating of the bearing on the shaft.

FAG hydraulic nuts can be used to aid the pressing-on operation. The reduction in the radial internal clearance is determined in the case of spherical roller bearings by measurement using feeler gauges.

The values given for the reduction in the radial internal clearance and the displacement distance on the taper lead to rigid seating of the bearing on the shaft, see table.

Reduction in the radial internal clearance and displacement distance on the taper 1:12

Nominal bearing bore diameter d mm		Reduction in radial internal clearance mm		Displacement distance on taper 1:12				Control value for minimum radial internal clearance after fitting		
				Shaft mm		Adapter sleeve mm		CN mm	C3 mm	C4 mm

Split plummer block housings SNS

Location of bearings with a cylindrical bore on the shaft

Bearings with a cylindrical bore are mounted in plummer block housings SNS on a stepped shaft. The bearing and then a spacer sleeve are slid onto the shaft. The outside diameter of the spacer sleeve must be selected such that it corresponds to the larger diameter of the stepped shaft. The seal is then slid onto the spacer sleeve. In the case of a housing closed on one side, a spacer sleeve is not used.

Spacer sleeves are not included in the scope of delivery of the housings.

Further information on mounting of bearings

- Machining tolerances for shafts:
Catalogue HR 1, Rolling Bearings
- Detailed information on mounting:
WL 80 100/3, Mounting of Rolling Bearings.

Mounting manual

The information on mounting and dismounting in this publication is aimed at the designer in order that he can take account, as early as the design stage, of all the requirements relating to mounting. There is a separate mounting manual for mounting personnel.

The mounting manual contains all the information that is required for safe, correct mounting.

Further information on mounting of housings

Ordering examples

The order for a split FAG plummer block housing SNS includes not only the housing but also the seals, covers or locating rings suitable for the specific application. The bearing is normally ordered at the same time. The appropriate combination of these components is given in the dimension tables.

Plummer block housings SNS are available as standard in the form of a non-locating bearing design. These can be converted into locating bearing arrangements through the insertion of locating rings NFR.

Designation structure

The designation structure of plummer block housings SNS is based on the designation structure of rolling bearings. The designation of the housing series is followed by the bearing size and finally the designation for the design variants and material, see table and *Figure 15*.

Designation structure
of plummer block housings SNS

Feature	Code	Description
① Housing series	SNS	Plummer block housing SNS
② ISO dimension series of bearing	30	ISO dimension series 22, 23, 30 and 40
	31	ISO dimension series 22, 23 and 31
	32	ISO dimension series 22 and 32
	40	ISO dimension series 40
③ Bore code of bearing	36	Bore code, two digits: ■ Bore diameter $(36 \cdot 5)$ mm = 180 mm
	/530	Bore code, three digits: ■ Bore diameter 530 mm
④ Housing design	H	Main design, see table, page 30
	Z	Additional design, see table, page 30
⑤ Housing material	D	Spheroidal graphite cast iron

Examples

The ordering examples show the construction of an order for a locating bearing arrangement and for a non-locating bearing arrangement.

Locating bearing arrangement

Plummer block housing SNS made from the standard material spheroidal graphite cast iron, closed on one side, spherical roller bearing 23136-E1A-K-M as a locating bearing, location by means of adapter sleeve, labyrinth seal.

Order	1 plummer block housing	SNS3136-H-D
	1 spherical roller bearing	23136-E1A-K-M
	1 adapter sleeve	H3136
	2 locating rings	NFR300/10
	1 cover	NDK36
	1 labyrinth seal	NTS36

Non-locating bearing arrangement

Plummer block housing SNS made from the standard material spheroidal graphite cast iron, continuous shaft, spherical roller bearing 23136-E1A-K-M as a non-locating bearing, location by means of adapter sleeve, Taconite seal.

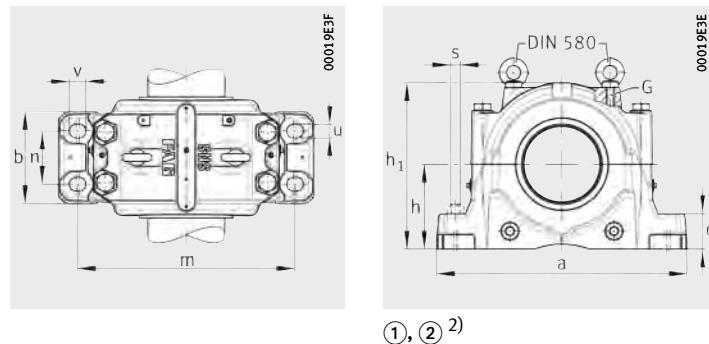

Order	1 plummer block housing	SNS3136-H-D
	1 spherical roller bearing	23136-E1A-K-M
	1 adapter sleeve	H3136
	2 Taconite seals	NTC36
